

The London Aesthetic Clinic

At the North London Health Centre

Dr Howard Daitz
MBChB MRCGP DFFP DCPRCP

Looking-and feeling-good helps us to live with confidence and part of that may be recognising and addressing the anti-aging battle.

The London Aesthetic Clinic offers a range of non-surgical anti-aging treatments –including **Botox***and **Dermal Fillers**–aimed at preventing the formation of wrinkles and smoothing out lines.

All treatments are carried out by Dr Howard Daitz, a General Practitioner, at his surgery, so you can be assured of medical expertise, the highest standards of hygiene and complete confidentiality.

Aesthetic Treatment with **Botox***

Botox* is a purified protein solution which, when injected leads to temporary muscle relaxation. When injected into the muscle groups that are causing wrinkles, it produces an improvement in lines in the upper face. The needles used are very fine and the injections are quite painless. Gradually, over 3-5 months, the **Botox*** effects will fade and the wrinkles may reappear. To avoid this, a repeat treatment is given every 3 months.

Botox* can also be used to stop underarm perspiration.

Dermal Fillers

The number of collagen cells in the skin reduces as part of the ageing process, leaving lines, wrinkles and some sagging of the skin. **Dermal Fillers** can create volume to fill out the crevices caused by these lines and wrinkles. They offer instant restoration of skin tone and suppleness and a visible reduction of lines and wrinkles from the first treatment.
